

Policy Advisory - 2025 Heat Season

Healthy Climate New Mexico *Health Professionals for Climate Action*

April 2025

Summary

This policy advisory addresses the urgent need to confront the public health risks posed by extreme heat in New Mexico. As global temperatures continue to rise, with this year projected to be among the [top three hottest](#) on record (only surpassed by 2023 & 2024), the Southwest region has already seen anomalous early heat, including [triple digit temperatures on April 10th](#). These conditions signal a troubling summer ahead. [Research shows](#) that when temperatures exceed 86 degrees, health impacts and emergency department visits increase across New Mexico. **To mitigate these risks and ensure the safety and well-being of all New Mexicans this heat season, immediate and comprehensive action is required.**

Key Recommendations

1. *Implement an evidence-based occupational heat standard to protect workers in high-risk occupations.*
2. *Improve public health surveillance systems to capture and analyze heat-related morbidity and mortality data in a timely manner.*
3. *Treat extreme heat as a mass casualty event, coordinating response efforts and ensuring appropriate emergency waivers and patient movement authority.*
4. *Enhance resilience against concurrent hazards such as electric grid failure and wildfires.*
5. *Provide safe, accessible, and culturally appropriate cooling centers, collaborating with organizations that serve vulnerable populations.*
6. *Distribute cooling supplies to public entities and non-profit groups working with vulnerable groups.*
7. *Stop utility shut offs during extreme heat to ensure people can run cooling devices without concern about cost.*
8. *Leverage existing helpline systems to provide heat-safety information and guidance on heat symptoms.*
9. *Be proactive in messaging, disseminating clear, consistent, and culturally tailored information about extreme heat risks and preventive measures.*
10. *Implement a rural and tribal community cooling program, providing outreach and support for energy assistance programs and air conditioner distribution or loan programs.*

Challenge and Opportunity

New Mexico is confronting an unparalleled challenge with the anticipated early onset of extreme heat due to record-breaking global temperatures. This situation poses substantial public health risks, especially among vulnerable and marginalized populations. The potential for concurrent hazards, such as wildfires or grid failures compounded by extreme heat, could lead to [devastating consequences for human life](#).

The number of emergency department visits for heat-related illness in New Mexico more than doubled between 2009 and 2019, and doubled again between 2019-2023. By taking proactive measures before the onset of extreme heat, New Mexico organizations, leaders, and communities have an opportunity to mitigate risks and foster more heat-resilient communities. Reducing heat-related injuries and fatalities, as well as tracking injuries and deaths that do occur, will be *critical* in ensuring the efficacy of our already strained healthcare and public health systems during extreme heat events. The proactive actions will help our communities be better equipped to withstand the repercussions of extreme heat while cultivating a healthier and more equitable future for all New Mexicans.

Plan of Action

To effectively reduce the public health risks associated with extreme heat in New Mexico, a comprehensive strategy encompassing the following measures is proposed:

Recommendation 1: Implement an Evidence-Based Occupational Heat Standard: Protect workers by developing standards for high-risk occupations (outdoor workers and people working in inadequately cooled indoor spaces). These regulations should include a mandatory acclimatization process, rest breaks, access to hydration, shade, monitoring, and other evidence-based safety protocols. While this needs to be implemented via traditional occupational safety procedures, the process is too slow and unlikely to be accessible to save lives this summer. State leadership should consider ways that a heat-related emergency declaration could rapidly implement these life-saving measures. [Occupational heat standards already exist in many states](#).

Recommendation 2. Improve Public Health Surveillance: Extreme heat morbidity and mortality surveillance systems are not (yet) adequate to provide critical information to assess and understand community risks at a detailed level, establish a baseline to track progress, or widely disseminate critical findings in a timely manner to those who can act to prevent injury. State officials need to provide the resources to modernize systems to capture and analyze heat-related morbidity and mortality in a timely manner. Morbidity and mortality data systems (hospital ED visits, death reporting, EMS calls, and other systems) need to be modernized to ensure interoperability. Unlike most states, New Mexico's centralized public health system could help facilitate these needed upgrades. [Maricopa County, AZ provides an example of how New Mexico could generate weekly heat surveillance reports](#).

Recommendation 3. Treat Heat as a Mass Casualty Event: Extreme heat kills more people in the US every year than any other extreme weather event. As the most pronounced impacts of extreme heat are patient surges to emergency departments, traditional emergency response agencies have struggled to appropriately intervene based on forecast data. By treating extreme heat like other extreme weather events

or an acute mass casualty event, anticipatory actions such as response coordination, resource prepositioning, and ensuring appropriate emergency waivers and patient movement authority is needed. [The 2021 Pacific Northwest heat dome provides an example of how mass casualty systems can be leveraged to support a regional heat response.](#)

Recommendation 4. Prepare for Concurrent Hazards: Enhance resilience against concurrent hazards, such as electric infrastructure failure and wildfires. Hospitals and other healthcare facilities must prepare for contingencies for losing power during extreme heat events to ensure critical health services can continue to be provided without interruption.

High temperatures accelerate the drying of fuels, increasing the likelihood of wildland fires. Extreme heat can decrease efficiency of electrical lines while increasing the demand for electricity for cooling creates critical strains on infrastructure. [Research looking at a multiday heat wave and simultaneous blackout in Phoenix found that tens of thousands of residents would likely die and hundreds of thousands would require emergency department care.](#)

Recommendation 5. Provide Safe, Accessible, and Culturally Appropriate Cooling Centers: Collaborate with organizations that serve vulnerable populations (housing insecure, elderly, etc.) to ensure cooling centers are safe, accessible, and welcoming. Ensure centers are appropriately stocked with cooling supplies, water, and ventilation systems and provide medical and behavioral health professionals to support urgent needs. These facilities should have backup power to ensure their functionality if power outages occur.

Mobile cooling centers should be considered, especially for high needs communities and in higher pedestrian trafficked areas. For example, [city buses could be parked](#) and running near unhoused people's public dwellings, athletic events, event spaces, and other heavily pedestrian trafficked areas.

Recommendation 6. Supply Cooling Resources to Organizations: Distribute cooling supplies (cooling packs, insulated water bottles, spray bottles, misting fans, etc.) to public entities and non-profit groups working with vulnerable groups, such those who are unhoused, people with substance use disorder, seniors, foodbanks, community centers in economically disadvantaged neighborhoods, and people living with disabilities. Consider pre-staging supplies at locations identified via relevant authorities, emergency response agencies, public health workers and community-based organizations.

Recommendation 7. Stop Utility Shut-Offs and Waive or Subsidize Costs for Low-Income Households: To protect those most vulnerable to extreme heat, utility companies should be prohibited from disconnecting essential utility services, such as electricity and water, during periods of extreme heat. Local and state authorities should work with utility companies to develop a program that mitigates the impacts of delayed payments, subsidizes expenses, or fully waives utility costs for low-income households during extreme heat events. [Moratoriums can trap low-income households in debt.](#) Information about utility shutoff programs must be widely disseminated and easily accessible to ensure that all residents, regardless of their financial situation, can maintain a safe indoor environment without fear of accruing unaffordable utility bills.

Recommendation 8. Hot-line Safety and Resource Information: Leverage existing hotline systems to provide critical heat-safety information, such as cooling center locations, tips to stay cool, and guidance on managing heat symptoms. This can be done by community organizations, municipalities, and state

departments. This has been implemented in multiple locations, including [Oregon](#), [Philadelphia](#), and [New York City](#).

Recommendation 9. Be Proactive in Messaging: Utilize various media platforms to disseminate clear, consistent, and culturally tailored messages about the risks of extreme heat and preventive measures to the general public. Establish a contact list of Tribal leaders, health-focused organizations, weather reporters, and community service organizations to notify when extreme heat is in the forecast. Collaborate with these recipients to deliver culturally appropriate and demographic-specific messaging to their communities. Strong relationships with community organizations, service providers, and first responders interacting with people who are unhoused and living in public spaces can act as critical communication multipliers through word of mouth.

Recommendation 10. Rural and Tribal Community Cooling Program: Accessing services in rural communities can be particularly challenging due to the dispersed geographic area and lack of infrastructure. Proactive outreach and funding to ensure homes are insulated and retrofitted to provide heating and cooling, reduce energy use, and that people in rural locations have access to cool spaces in case of power loss. Outreach and support for energy costs (see Recommendation 7) and air conditioner distribution, heat pump installation, or equipment loan programs can ensure that rural and tribal communities are not further disadvantaged by heat-related expenses.

Conclusion

The health of every New Mexican is increasingly threatened by the early onset of longer and more extreme heat seasons. These ten recommendations represent concrete actions that can save lives and build more resilient communities as temperatures rise. As health professionals, we urgently call on state and local governments and community organizations to implement these protective measures before dangerous summer heat arrives.

While leaders across New Mexico increasingly recognize the threat of extreme heat to our communities, acknowledgment and plans must transform into action. The ten recommendations in this advisory aren't theoretical—they've been successfully implemented in communities across the country and around the world, proving both their feasibility and effectiveness in reducing heat-related impacts.

Taking action now is essential to protect all New Mexicans, particularly our most vulnerable residents who face disproportionate heat risks. Children, older adults, outdoor workers, people with chronic health conditions, and those with limited access to air conditioning suffer the greatest burden during extreme heat events. A proactive approach that prioritizes these populations will save lives and reduce preventable emergency department visits.

By implementing these recommended measures and establishing funding mechanisms to support them, we can ensure our communities develop the necessary resilience to withstand increasingly frequent and severe heat events. The time to act is now—before another summer brings preventable suffering and deaths to our communities and state.
